Intelligent agent and distributed AI (DAI) approaches attach specific conditions to cooperative exchanges between intelligent systems, that go far beyond simple functional interoperability. Ideally, systems that pursue local or global goals, coordinate their actions, share knowledge, and resolve conflicts during their interactions within groups of similar or dissimilar agents can be viewed as cooperative coarse-grained systems. The infrastructure of telecommunications is a world in transition. There are a number of trends that contribute to this: convergence of traditional telephony and data network worlds, blurring of boundaries between public and private networks, complementary evolution of wireline, wireless, and cable network infrastructures, the emergence of integrated broadband multimedia networks and, of course, the information superhighway. Up to now, despite the effort that has gone into this area, the field of intelligent agents research has not yet led to many fielded systems. Telecommunications applications pose strong requirements to agents such as: reliability, real-time performance, openness, security management and other integrated management, and mobility. In order to fulfil their promise, intelligent agents need to be fully dependable and typically require an integrated set of capabilities. This is the challenge that exists for intelligent agents technology in this application domain. Business Data Communications, 6/e, is ideal for use in

The Standard Handbook of Electronics Engineering has defined its field for over thirty years. Spun off in the 1960's from Fink's Standard Handbook of Electrical Engineering, the Christiansen book has seen its markets grow rapidly, as electronic engineering and microelectronics became the growth engine of digital computing. The EE market has now undergone another seismic shift—away from computing and into communications and media. The Handbook will retain much of its evergreen basic material, but the key applications sections will now focus upon communications, networked media, and medicine—the eventual destination of the majority of graduating EEs these days.

This module discusses the network services and architectures in the Internet World. topics include network architectures, network connectivity, IP-based networks, broadband networks, wireless networks, and Next Generation Internet.

making IT investments by detailing how computerization does not automatically create business value, but is one essential component that should be coupled with organizational changes such as new strategies, new business processes, and new organizational structures." Data and Computer Communications, Eighth Edition offers a clear, comprehensive, and unified view of the entire fields of data communications, networking, and protocols. William Stallings organizes this massive subject into small, comprehensible elements, building a complete survey of the state-of-the-art, one piece at a time. Stallings has substantially revised this international best-seller to reflect today's latest innovations, from WiFi and 10 Gbps Ethernet to advanced congestion control and IP performance metrics.

Um tipo importante cada vez mais importante de rede móvel é a rede ad hoc, também conhecida como MANET (Mobile Ad hoc NETWORK), onde os dispositivos são capazes de trocar informações diretamente entre si. Ao contrário do que ocorre em redes convencionais, não há pontos de acesso, ou seja, não existem estações de suporte à mobilidade (sem infraestrutura de conexão) e os nós dependem uns dos outros para manter a rede conectada. Por esse motivo, redes ad hoc são indicadas principalmente em situações onde não se pode, ou não faz sentido, instalar uma rede fixa. Os nós de uma rede ad hoc podem se mover arbitrariamente. Deste modo, a topologia da rede muda frequentemente e de forma imprevisível. Assim, a conectividade entre os nós móveis muda constantemente, requerendo uma permanente adaptação e reconfiguração de rotas. Associado a esse

fato, limitações de banda passante e de energia das baterias dos nós torna o roteamento, principalmente o multiponto, em redes ad hoc um desafio.

to employee collaboration and electronic commerce. The subjects contained in this book all transcend specific skills of engineers, experts, or management scientists, emphasizing holistic as well as analytical approaches for problem identification and solving in new and unpredictable situations. The greater the complexity of engineering projects, the higher the probability of committing elementary errors; the papers presented in this book stress the need for flexibility and the concentration of forces in production economics, in order to propose and implement approaches and solutions which can be adapted to continuously changing circumstances. The state-of-the art of production economics is approaching a critical point in its evolution where it can be seen as part of a greater network, involving people and locations throughout the world. It is hoped that the readers of this volume will perceive production economics as an ongoing and open project, as a methodological work in progress, which requires the combined efforts of scientists and practitioners for coping with the many open questions that it poses.
