While several publishers (including O'Reilly) supply excellent documentation of router features, the trick is knowing when, why, and how to use these features There are often many different ways to solve any given networking problem using Cisco devices, and some solutions are clearly more effective than others. The pressing question for a network engineer is which of the many potential solutions is the most appropriate for a particular situation. Once you have decided to use a particular feature, how should you implement it? Unfortunately, the documentation describing a particular command or feature frequently does very little to answer either of these questions. Everybody who has worked with Cisco routers for any length of time has had to ask their friends and co-workers for example router configuration files that show how to solve a common problem. A good working configuration example can often save huge amounts of time and frustration when implementing a feature that you've never used before. The Cisco Cookbook gathers hundreds of example router configurations all in one place. As the name suggests, Cisco Cookbook is organized as a series of recipes. Each recipe begins with a problem statement that describes a common situation that you might face. After each problem statement is a brief solution that shows a sample router configuration or script that you can use to resolve this particular problem. A discussion section then describes the solution, how it works, and when you should or should not use it. The chapters are organized by the feature or protocol discussed. If you are looking for information on a particular feature such as NAT, NTP or SNMP, you can turn to that chapter and find a variety of related recipes. Most chapters list basic problems first, and any unusual or complicated situations last. The Cisco Cookbook will quickly become your "go to" resource for researching and solving complex router configuration issues, saving you time and making your network more efficient. It covers: Router Configuration and File Management Router Management User Access and Privilege Levels TACACS+ IP Routing RIP EIGRP OSPF BGP Frame Relay Queueing and Congestion Tunnels and VPNs Dial Backup NTP and Time DLSw Router Interfaces and Media Simple Network Management Protocol Logging Access Lists DHCP NAT Hot Standby Router Protocol IP Multicast

As the current recession ends, many workers will not be returning to the jobs they once held--those jobs are gone. In *The New Division of Labor*, Frank Levy and Richard Murnane show how computers are changing the employment landscape and how the right kinds of education can ease the transition to the new job market. The book tells stories of people at work--a high-end financial advisor, a customer service representative, a pair of successful chefs, a cardiologist, an automotive mechanic, the author Victor Hugo, floor traders in a London financial exchange. The authors merge these stories with insights from cognitive science, computer science, and economics to show how computers are enhancing productivity in many jobs even as they eliminate other jobs--both directly and by sending work offshore. At greatest risk are jobs that can be expressed in programmable rules--blue collar, clerical, and similar work that requires moderate skills and used to pay middle-class wages. The loss of these jobs leaves a growing division between those who can and cannot earn a good living in the computerized economy. Left unchecked, the division threatens the nation's democratic institutions. The nation's challenge is to recognize this division and to prepare the population for the high-wage/high-skilled jobs that are rapidly growing in number--jobs involving extensive problem solving and interpersonal communication. Using detailed examples--a second grade classroom, an IBM managerial training program, Cisco Networking Academies--the authors describe how these skills can be taught and how our adjustment to the computerized workplace can begin in earnest.

The success of today's military officers rests squarely on the shoulders of the men and women of the past. In *Striving for Perfection*, author Gerald D. Curry, a former US Airforce Colonel, reaches back through the annals of history to help today's professional military officers navigate a successful career. Curry shares rarely known insights on historical accomplishments from every major war in US history, from the Revolutionary War through the Global War on Terrorism. He pulls unique examples of success strategies, cultural understandings, and sage advice from African American servicemen and women who have worn the uniform. *Striving for Perfection* goes beyond the typical leadership principles by offering significant experiences told from an African American perspective—from the only people deliberately brought to America for the sole purpose of servitude. Curry shows how black American patriots consistently looked beyond their current circumstances and served gallantly while seeking equality and social justice. This guide describes the barriers that have existed within most African American communities, and it narrates how these neighborhoods continually birth great leaders. Although geared toward military professionals, *Striving for Perfection* can help all leaders in any profession who supervise and work with African Americans. Introducing proven success strategies, it provides a better understanding of diversity and inclusion.

The Workshop on the Knowledge Economy and Postsecondary Education documents changes seen in the postsecondary education system. In her report Lisa Hudson focuses on who is participating in postsecondary education; Tom Bailey concentrates on community colleges as the most responsive institutions to employer needs; Carol Twigg surveys the ways that four-year institutions are attempting to modify their curricular offerings and pedagogy to adapt those that will be more useful; and Brian Pusser emphasizes the public's broader interests in higher education and challenges the acceptance of the primacy of job preparation for the individual and of "market" metaphors as an appropriate descriptor of American higher education. An example of a for-profit company providing necessary instruction for workers is also examined. Richard Murnane, Nancy Sharkey, and Frank Levy investigate the experience of Cisco high school and community college students need to testify to their information technology skills to earn certificates. Finally, John Bransford, Nancy Vye, and Helen Bateman address the ways learning occurs and how these can be encouraged, particularly in cyberspace.
