This volume is the third edited by Drs. Dickson and Lippman in the 'Advances in Cellular and Molecular Biology of Breast Cancer' series. It continues to explore the scientific themes begun in the first two volumes: oncogenes and antioncogenes, growth factors, steriods, and stromalepithelial interactions. Rapid and important progress has continued to take place in all of these areas, especially the possibility that the new molecular understanding of regulation of growth, differentiation and metastases will lead to better tumor prognosis and treatment. For this reason this volume begins with two excellent chapters in this area. Genes, Oncogenes, and Hormones is divided into five sections: (1) the progression of node negative to positive breast cancer, (2) suppressor genes and regulation growth factors, (3) oncogenes and stimulatory growth factors, (4) steroidal hormone receptors, (5) differentiation and function of breast cancer epithelium and stroma. This volume will be useful to clinical researchers, basic researchers, and students in the breast cancer field. It complements and adds to the previous two volumes edited by Drs. Lippman and Dickson in this series.

This guide considers the work of research alongside life's many other responsibilities, showing how to juggle it with work, family, and friends. "After being frequently urged to write upon this subject, and as often declining to do it, from apprehension of my own inability, I am at length compelled to take up the pen, however unqualified I may still feel myself for the task. " William Withering, M. D. ' I have yet to find a description or a quote that better summanzes my initial ambivalence towards embarking on such an endeavor as partici pating in putting together this monograph. The impetus for The Red-Cell has been a simple, genuine Membrane: A Model for Solute Transport desire to bring together an authoritative account of the 'state of the art and knowledge" in the red-cell-membrane transport field. In particular, it seems important to emphasize the pivotal role the red cell has played for several decades in the discovery and the elucidation of mechanisms of plasma-membrane transport processes. It is only with such knowledge that we can hope to push ahead and make progress in this exciting, multifaceted area. Eventually, one hopes to not only further our knowledge of red cells, but apply the newly gained insights to any other of the plasma membrane. cell with the common denominator In this compendium of reviews, the reader will find that the term model will take on a variety of gists and meanings. In some chapters, the red cell has been chosen as a model membrane solely on the basis of its preeminent design and simplicity.
