Clinics in Developmental Medicine No. 158 Over the past 10-15 years there has been a significant increase in the understanding of migraine and tension headache in children but there is currently no single source of current information for paediatric neurologists and paediatricians. In this book an international team of experts in the headache area addresses that gap and provides an extensive and detailed review of the recent findings in migraine and tension headache as well as headaches caused by underlying neurological disorders. They give an up-to-date assessment of the causes of childhood headache and better definitions and criteria for diagnosis, pointing the way to important future areas of research. This book, with its evidence-based plans of management and guidelines for investigations, will be essential reading for all clinicians treating headache in children.

The frequent headache syndromes are among the most challenging disorders that confront clinicians on a routine basis. The purpose of *Chronic Daily Headache for Clinicians* is to provide a practical guide for clinicians to both understand and manage patients with frequent headache. The foremost clinicians in each area will review in a very focused way the diagnostic and management issues for the

most important and challenging disorders that present with frequent headache. Specific types of headaches examined include Chronic Migraine, Tension-Type, Chronic Cluster, Hypnic, Low-CSF Volume, and those headaches associated with Head Trauma, among others. Chronic Daily Headache for Clinicians will bring clinical clarity to these disorders in order to be appropriately studied in terms of their primary headache biology.

Includes supplements.

This book provides essential insights into the current state of knowledge regarding the main aspects of cluster headache and trigeminal autonomic cephalgias. The first chapters focus on classification and clinical features, together with familial and genetic aspects. Relevant animal models and the putative role of key nervous structures as the hypothalamus, brainstem, diencephalon and sphenopalatine ganglion are reviewed. Evidence gained from key molecules such as CGRP in animals and human headache models are discussed. The book subsequently presents information on the various aspects of the pathophysiology of trigeminal autonomic cephalgias for example regarding the implication of the trigeminovascular system and the facial autonomic reflexes of the brainstem. Further, it shares insights from imaging studies including functional magnetic resonance imaging and more

advanced techniques, as well as brain stimulation procedures. Further chapters describe the current state of knowledge concerning drug treatment and the various neurostimulation procedures. Trigeminal neuralgia is also presented, due its close relationship with some short-term trigeminal autonomic cephalgias: a great deal can be learned from a better understanding of their differences and similarities. The same approach is then applied to cluster headache and migraine. All chapters were written by respected experts in their fields, ensuring the book will provide an excellent source of up-to-date information and perspectives on trigeminal autonomic cephalgias and related disorders. As such, it will be of considerable value for students, clinicians and pain researchers alike.

This book is a comprehensive guide to the management of headaches. Divided into five sections, chapters are presented in a question and answer format. The book begins with an overview of headaches, explaining classification, diagnostic testing and pathophysiology. The following sections cover primary headaches (migraine, tension-related) and secondary headaches (post trauma, vascular-related, infections). The final sections discuss headaches in specific patient groups such as children, the elderly, women, and in pregnancy; and complementary and alternative therapies. Key points

Comprehensive guide to management of headaches

Covers both primary and secondary headaches, and specific patient groups Includes section on complementary and alternative therapies Highly experienced, internationally recognised editor and author team

Headache syndromes rank amongst the most common presenting symptoms in general practice and neurology, affecting up to 15% of the adult population. Part of the Oxford Textbooks in Clinical Neurology series, the Oxford Textbook of Headache Syndromes provides clinicians with a definitive resource for diagnosing and managing patients with primary and secondary forms of headaches, either as isolated complaints or as part of a more complex syndrome. Split into 7 key sections with 59 chapters, this comprehensive work discusses the scientific basis and practical management of headache syndromes in a logical format. Each chapter is written by international experts in neurology who share their research and extensive experience by providing a wealth of practical advice for use in clinical situations. In addition, all content is up-to-date and chapters incorporate discussions on the latest International Classification of Headache Disorders 3rd edition when relevant.

Discussing real-world cases, this practical guide highlights areas of diagnostic uncertainty and shows common pitfalls in headache diagnosis and treatment.

**Background and Aims:** Post-dural puncture headache (PDPH) is the most common complication following accidental dural puncture (ADP) and is particularly frequent after epidural analgesia in obstetrics. The aim of our study is to describe the incidence and management of PDPH after epidural analgesia in obstetrics in our hospital, as well as the efficiency of our PDPH protocol in clinical practice.

**Methods:** We included all obstetric patients ( $n=2703$ ) who received epidural anaesthesia for labour during 2016 and 2017. Patients with reported ADP and those in whom ADP was not noticed and develops PDPH, started postpartum standardized treatment for PDPH. It included conservative therapies such as bed rest, hydration, corticoids and analgesics. If headache continued after 48 hours, an epidural blood patch (EBP) was performed. Incidence of PDPH, number of patients who received EBP, the day in which EBP was made and the remission of headache were reported.

**Results**The incidence of obstetric ADP in our

centre is 1.15% (31/2703), 64.5% (20/31) of them developed PDPH. EBP was performed in 65% (13/20) of women with persistent headache. PDPH was relieved in 12/13 (92.3%) of them and one case needed a second EBP. The median day until the EBP was performed was 4 days (range 3-6). Conclusions: The incidence of PDPH after ADP in our centre is within than the average published. The EBP is a useful technique for treatment in patients with unsuccessful conservative management of PDPH.

Comprises the proceedings of the various sections of the society, each with separate t.-p. and pagination.

Intended to promote a more appropriate and modern therapeutic approach to migraine management, this book is the first to deal with monoclonal antibodies in this context. Authored by the most respected migraine experts from around the globe and drawing on the lessons learned in both clinical trials and clinical practice, it reviews the current state of knowledge on this important therapeutic innovation, which has produced impressive data in randomized controlled trials, and the efficacy and safety of which have been confirmed in day-to-day real-world use. Given its scope, the book will appeal to a broad range of specialists, including pharmacologists, clinical pharmacologists, neurologists and internists, but also to residents and medical students.

Most volumes include section "Books of the year." Thoroughly updated for its Second Edition, this handbook is a practical, easily accessible guide to the diagnosis and management of headache patients.

Geared to both primary care physicians and neurologists, the book presents a systematic approach to diagnosis and offers expert recommendations for treating all types of headaches, including migraine, chronic daily headache, tension and cluster headaches, post-traumatic headaches, headache during pregnancy, headache in children, headaches with onset after age 50, and headaches caused by HEENT disorders. This edition includes new drug treatments such as topiramate, almotriptan, frovatriptan, eletriptan, botulinum toxin, and tizanidine. Also included are 42 case studies, patient education materials, alternative treatments, and a medicolegal section.
